MPX-8188 IEEE 802.11 b/g/n PCIE WIFI module is a highly integrated wireless local area network (WLAN) solution to let users enjoy the digital content through the latest wireless technology without using the extra cables and cords. It enables a **high performance, cost effective, low power, compact solution** that easily fits onto two sides of the PCI Express half mini Card.

Compliant with the IEEE 802.11b/g/n standard, MPX-8188 uses Direct Sequence Spread Spectrum (DSSS), Orthogonal Frequency Division Multiplexing (OFDM), BPSK, QPSK, CCK and QAM baseband modulation technologies.

Compare to 802.11g technology, 802.11n standard makes big improvement on speed and range.

Faster Speed: WLAN up to 150Mbps data rate.

MPX-8188 module adopts Realtek **RTL8188EE** solution. The module design is based on the Realtek RTL8188EE solution.

- * High speed wireless connection up to 150 Mbps for Wi-Fi
- * 1 antennas to support 1(Transmit) x 1(Receive) diversity technology
- * Low power consumption and high performance
- Enhanced wireless security
- * Support Mini card PCI-E 1.1 & 1.2 standard specification
- * Support WOWL

4.3 < LED mode behavior >

State	Definition	Interpretation
OFF	The LED is emitting no light.	Radio is incapable of transmitting.
		This state is indicated when the card is not powered, the W_DISABLE# signal is asserted to disable the radio, or when the radio is disabled by software.
ON	The LED is emitting light.	Radio is capable of transmitting.
		The LED should remain ON even if the radio is not actually transmitting. For example, the LED remains ON during temporary radio disablements performed by the Mini Card of its own volition to do scanning, switching radios/bands, power- management, etc.
		If the card is in a state wherein it is possible that radio can begin transmitting without the system user performing any action, this LED should remain ON.

4.4 < Power UP Sequencing >
